

Basis on Ergo: P2P Money for Humans & AI Agents

The Vision

P2P Money for the Digital World

“ Local Trust, Global Settlement ”

Goals

- Humans trading in **local communities** (possibly over mesh)
- **AI agents** creating autonomous economic relationships
- **Optional collateral** via blockchain when trust is insufficient

Today's State

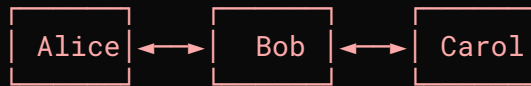

- Lightning/Cashu require **100% collateral**, so no credit expansion
- Blockchain fees too high for **micropayments**
- No solutions for **occasionally-connected** areas

P2P Interactions

Human-to-Human

- Credit-based trading within community
- Backed by blockchain assets when there is no trust
- Blockchain sync when connected
- Redemption possible via slow links (SMS, email)
- Tracker can be changed freely, it can't steal

Disconnected Village

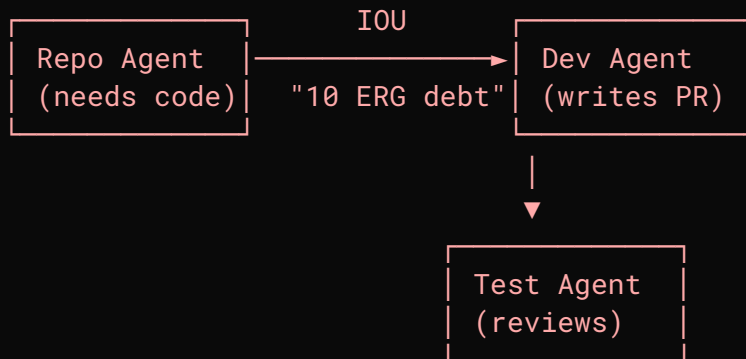

Local Tracker
(syncs when Internet available)

P2P Interactions

Agent-to-Agent (Autonomous Economy)

- Autonomous credit relationships
- Reserve created after work completes
- Humans providing economic feedback by providing reserves (backing)

P2P Interactions

Micropayments for Content

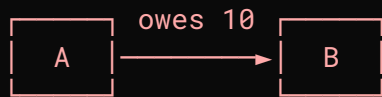

Pay-per-article without subscriptions

- Publisher accepts reader's IOU
- Small amounts, no on-chain fees
- Redeem aggregated debt later

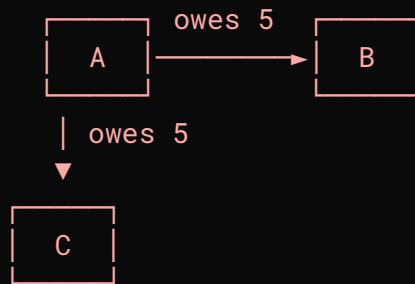

P2P Interactions

Triangular Trade (Debt Transfer)

Before:

After Transfer:

B buys from C → A's debt transfers (with A's consent)
No on-chain redemption needed!

Why Ergo?

- **UTXO model**: perfect for off-chain interactions
- **Smart contracts** and **Trust-minimized De-Fi Stack** to continue on-chain
- **PoW security**

Monetary Expansion

Reserve Collateral Options

- ERG (native)
- Bitcoin (via bridges/wrapping)
- Tokenized gold, silver, commodities
- Stablecoins
- Basket tokens, and so on

Impact on Ergo Ecosystem

Boosting DeFi & ERG Demand

Direct Benefits

- **ERG as min-trust collateral** — reserves locked in contracts
- **Increased on-chain activity**
- **TVL growth** — more value secured on Ergo

More users → More reserves → More ERG demand → Higher security

Why This Matters

For Humans

- **Free banking for everyone**
- **Works offline:** trade without Internet (over Mesh etc)
- **No forced collateralization** when trust is enough

For AI Agents

- **Autonomous economics:** agents pay agents
- **Agentic economics:** via self-sovereign credit creation, agents can become in the center of value production
- **No human-controlled third-parties:** pure agentic P2P

For the World

- **Alternative to political money:** self-sovereign grassroots issuance
- **Local credit, global settlement:** best of both worlds
- **Elastic money supply:** expands with trust when possible
- **Individual risk:** the system does not force to accept debt, it is individual choice of every user

Open Source Community

Built by and for the Commons

- No token
- **Free, open source** community project
- **Permissive license** — use, modify, deploy freely
- No venture capital, no corporate control
- Developed transparently on GitHub
- Contributions welcome from all

Monetization Possibilities

For Operators & Entrepreneurs

- **Run a tracker node** — earn fees on settlements
- **Issue backed IOUs** — create local credit systems
- **Liquidity provision** — earn from reserve management
- **Gateway services** — on/off-ramp for cash ↔ crypto
- **Custom deployments** — white-label for communities

For Developers

- **Consulting & support** — help communities deploy
- **Protocol fee** - default option for tracker
- **Extend the protocol** — grants, bounties, donations

Current Status

✓ Working

- Reserve contract on Ergo
- Tracker prototype
- P2P payment flows tested

Building

- Rust implementation (production server)
- Mesh network demos
- Agent economy simulations
